

Shorter Time to Insight,
More Adaptable,
Less Costly
Business Intelligence
with
Data Vault

Presented by Daniel Upton

The Business Intelligence Promise: Smarter, more fact-based decision-making as an everyday routine

PerformanceG2, Inc. is a full service performance management consultancy and advisory experts who specialize in helping business leaders drive the value of their data and or analytic environment to ultimately allow them to think smarter, act faster, and grab a competitive edge. Our goal is to guarantee that our clients have the right knowledge and intelligence of their business – customers, products, markets, and people, and we do so by partnering with the best technology companies and hiring the top consultants and trainers.

www.performanceg2.com

Daniel Upton, owner and principal consultant at **DecisionLab LLC**, is a Certified Data Vault Data Modeler. A frequent speaker, blogger, and advocate for agile methods in the business intelligence and analytics space, he has used his unique EDW model-storming method to quickly implement Data Vaults for many organizations nationwide. Daniel is pleased to **partner with PerformanceG2** to deliver the benefits of a data warehouse that is more robust, faster to deliver, easier to adapt, and less costly to maintain than previously considered possible.

www.decisionlab.net

Without a Data Warehouse, BI reporting gets bogged down...

- * slow query performance
- * insufficient drill-down to details, and
- * mission critical reports with conflicting data.

A Data Warehouse can resolve those issues, but has been...

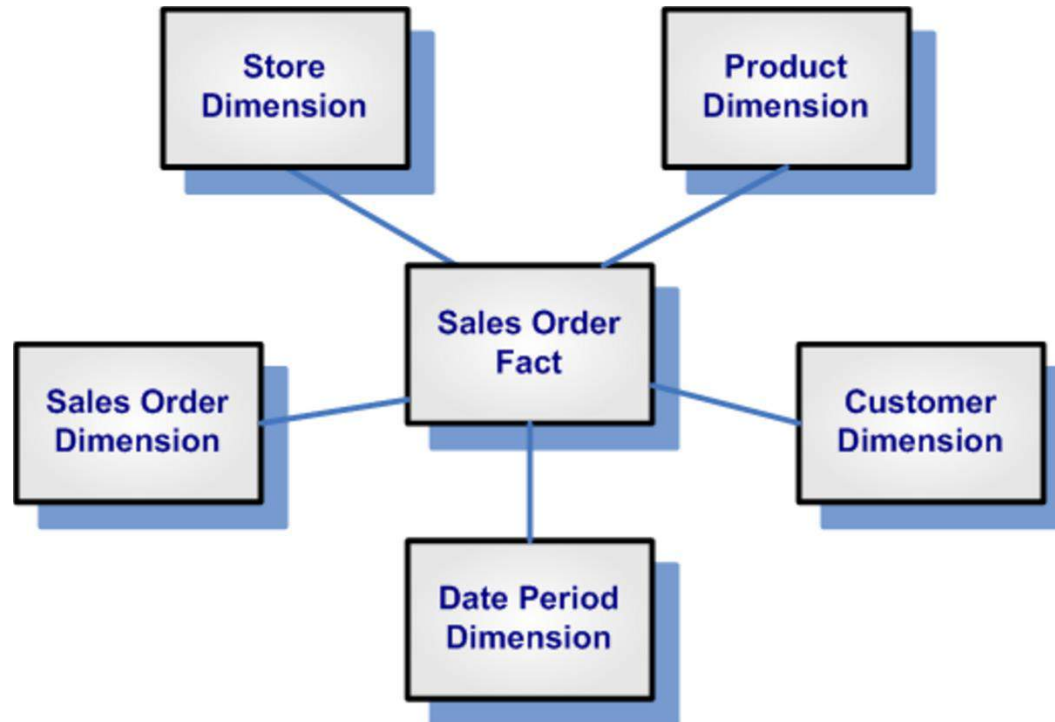

- * time consuming to build
- * slow to adapt to rapid business changes
- * costly not only to build, but even to maintain.

Why so?

Star Schemas:

Appealing simplicity to less technical users, but to load them, the facts, with their new, hard-coded business rules become dependent on dimensions, with their own set of hard-coded rules, making these models, and their loading code, time-consuming to design and load, and ...**costly to evolve or change even in small ways** once delivered. Meanwhile, source system data, business rules, and reporting requirements continue to evolve faster and faster.

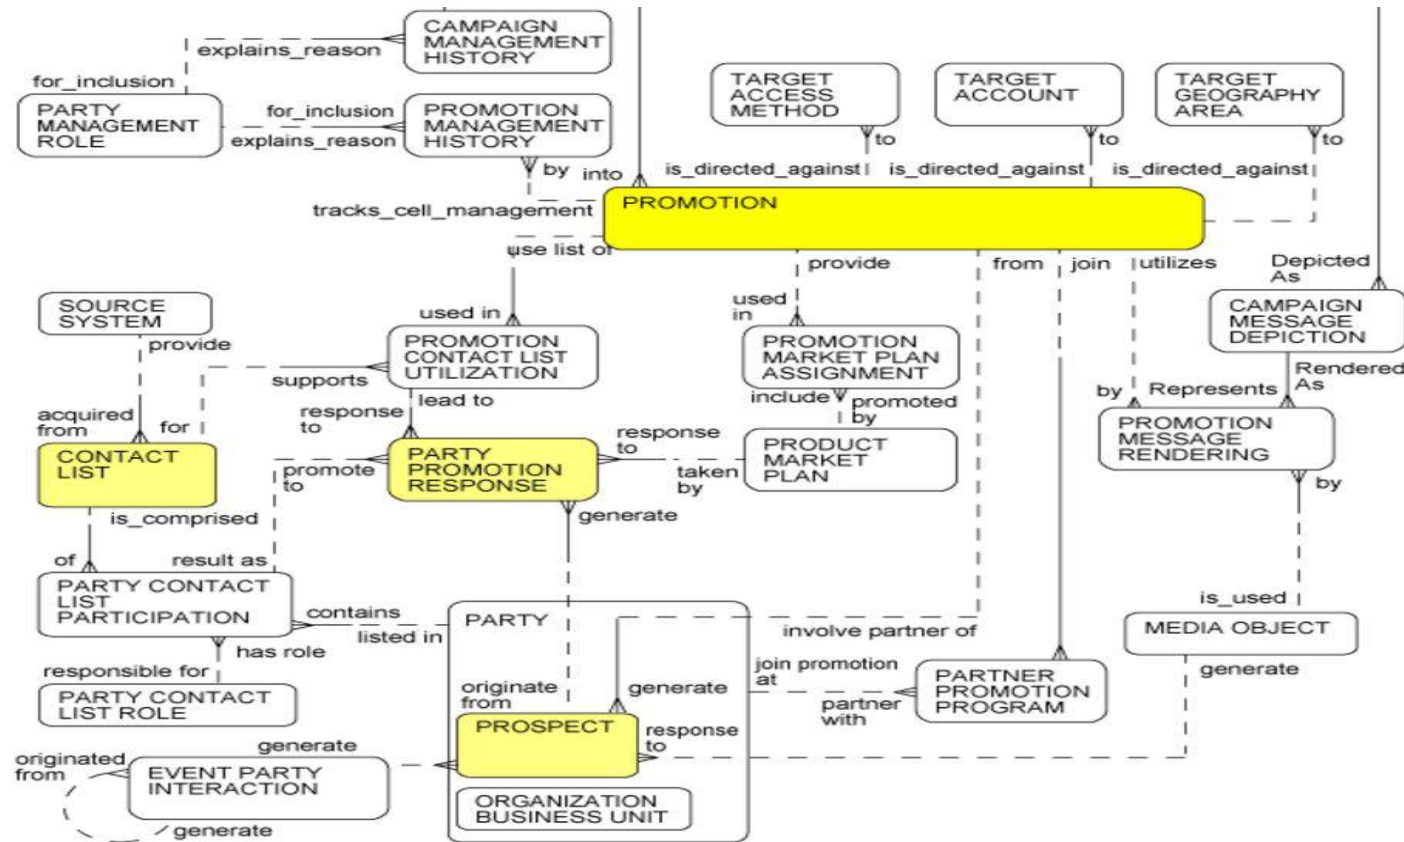

So, with a delivered old school 'Straight to Star Schema' architecture, even without a need for major enhancements ...**business intelligence maintenance costs increase over time.**

Back in the day, the potential opportunity to...

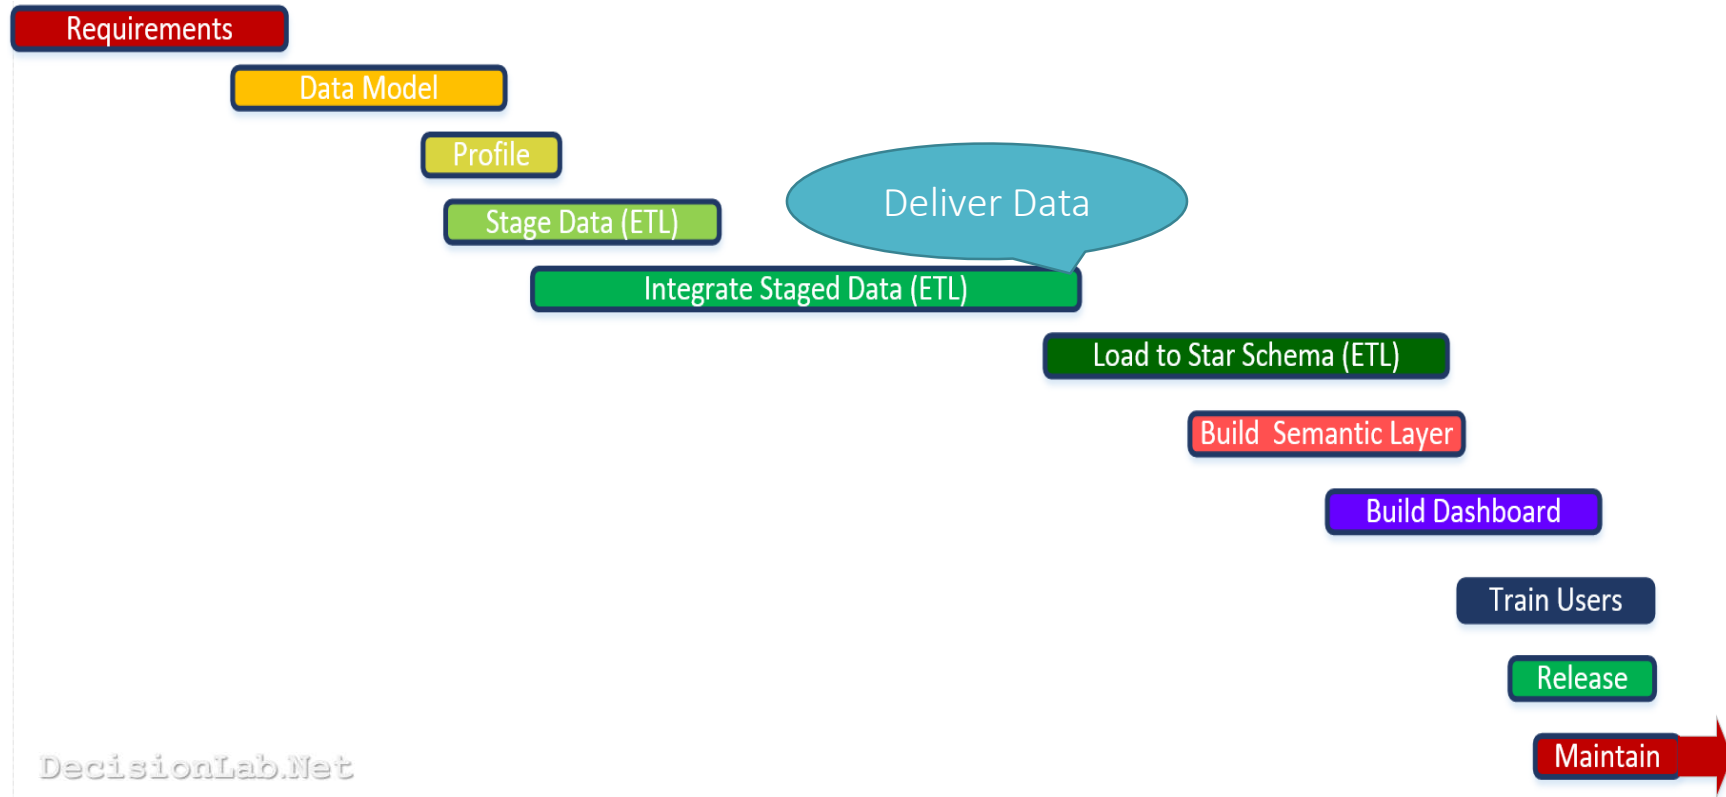

**“Build your integrated data warehouse now.
Easily add new operational data, new rules, and new relationships whenever needed”**

...would never have been suggested by an honest, experienced practitioner.

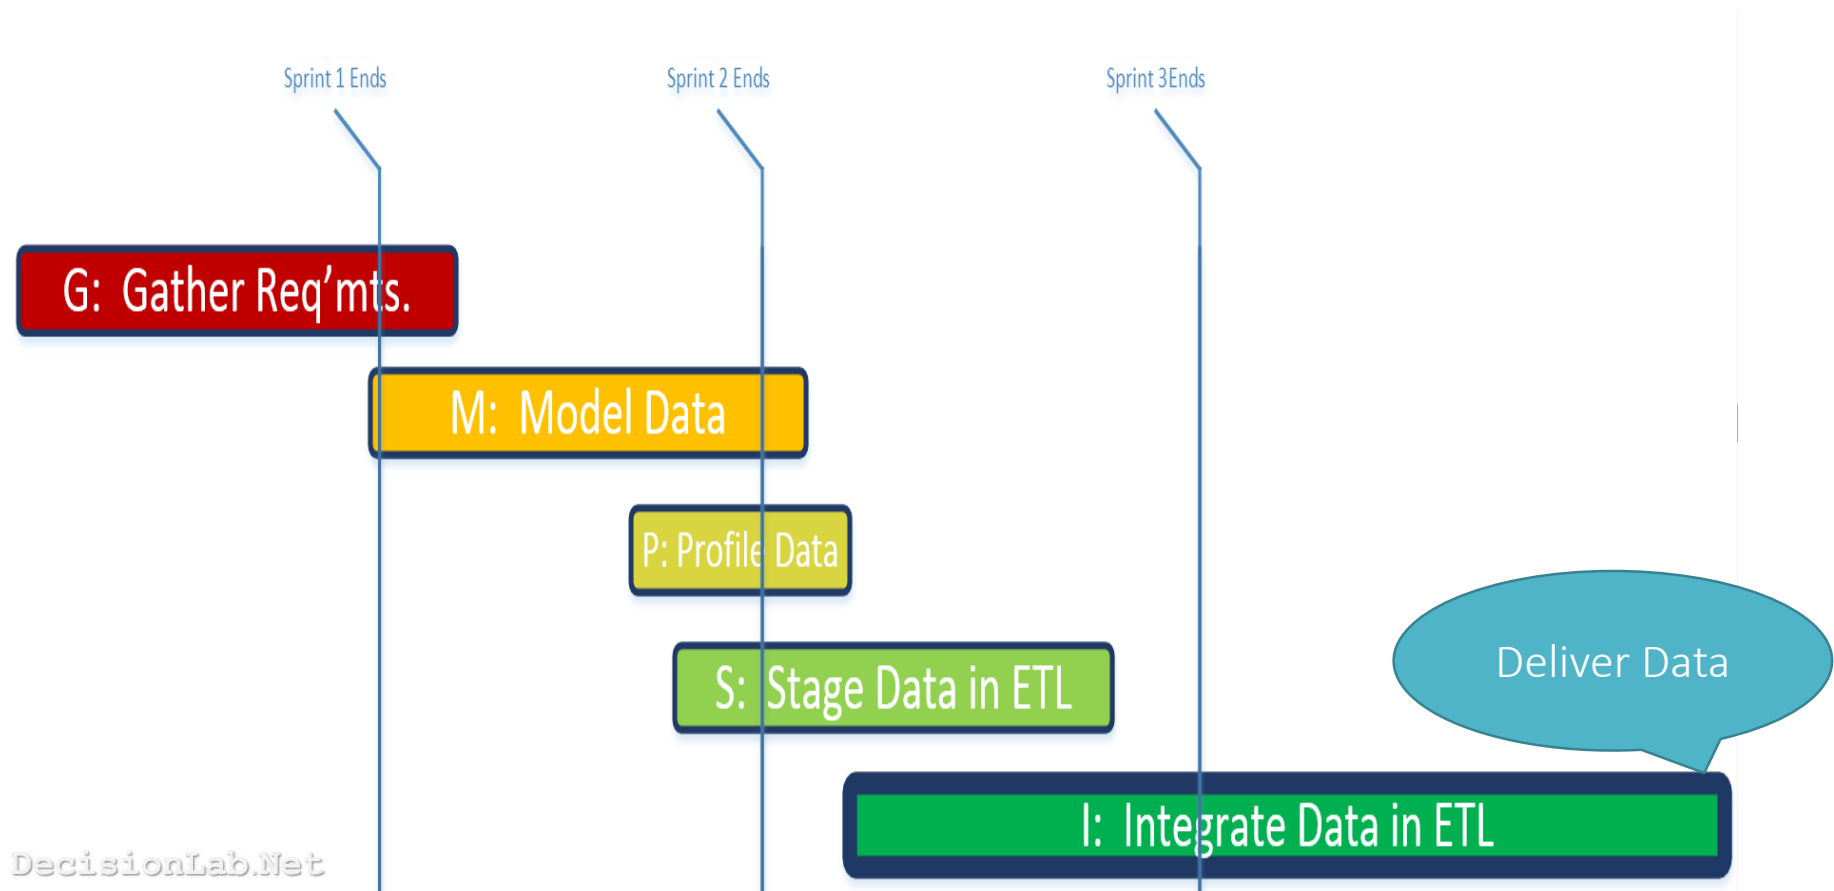

Why do old school data warehouses take so long to deliver?

Data dependencies result in task dependencies

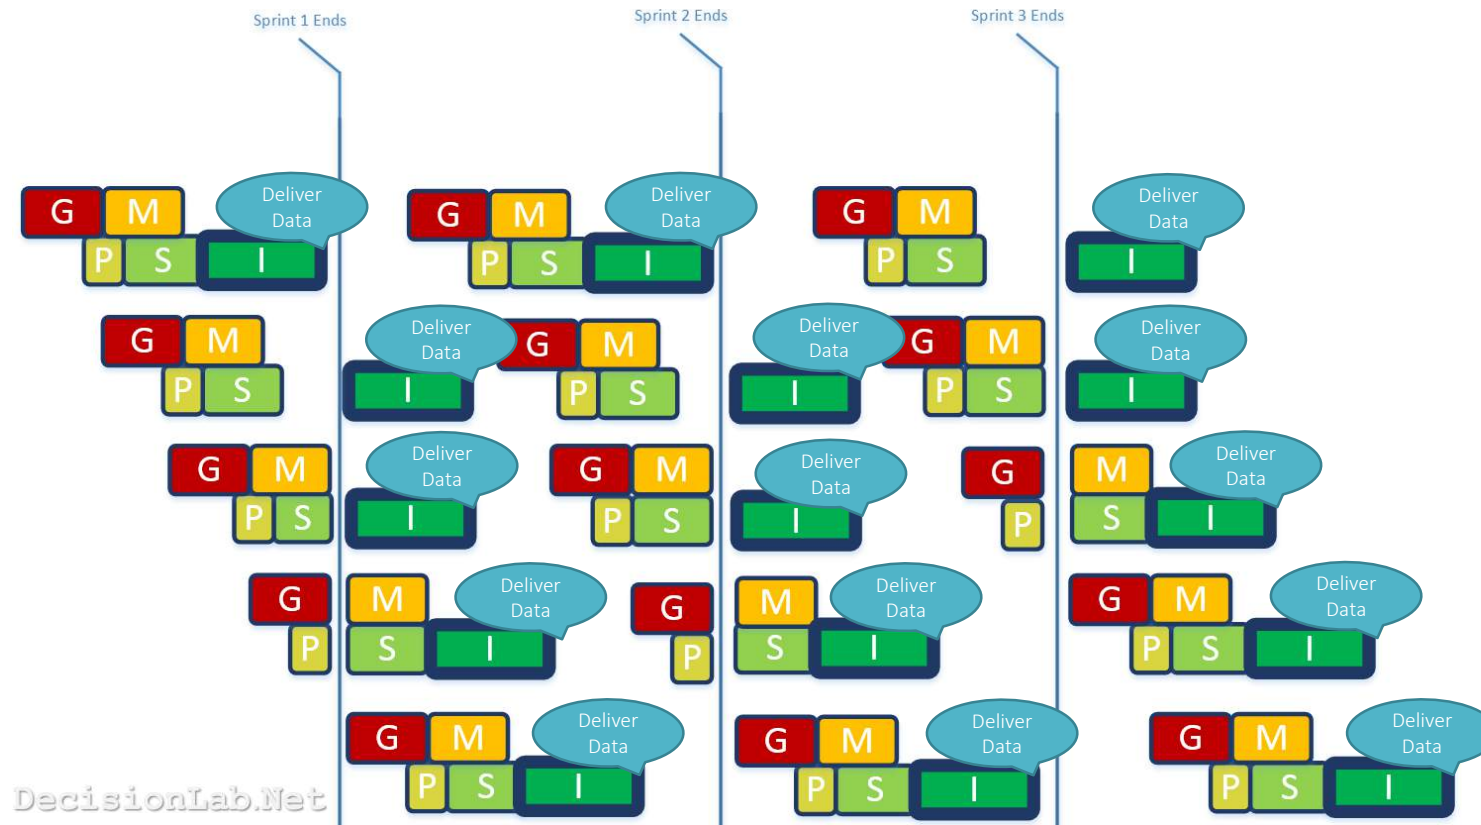

The five most difficult, most sequential tasks

Critical Path Delays

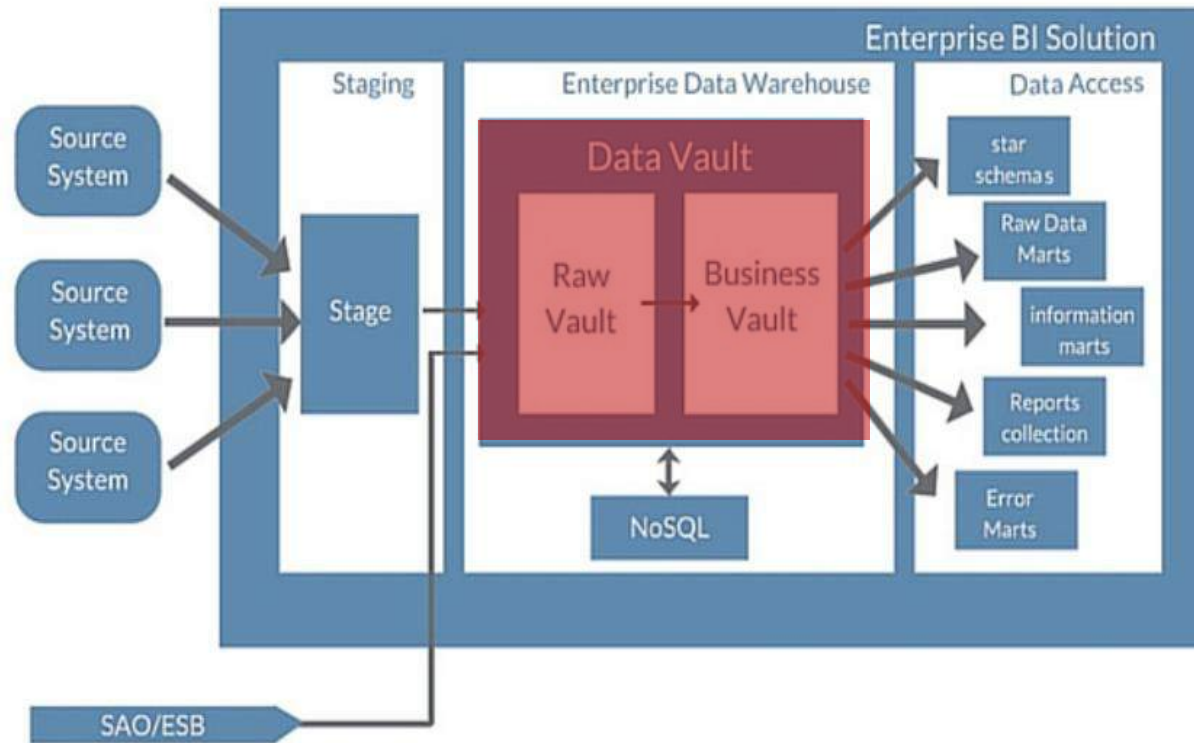

Data Vault Architecture, especially with Modelstorming, shortens tasks and their dependencies into smaller, time-boxed iterative tasks by loosely coupling and quickly warehousing the data before applying business rules for reporting or analytics.

Data Vault is a platform-agnostic architecture.

High Level Data Vault BI-Solution Architecture

Who is using Data Vault? ~ 2,000 worldwide implementations

Simple Business Case: University

Alumni Development specialists must know which donors donate how much and when, in order to ensure donors receive recognition and benefits.

Institutional Research must know how many students enrolled weekly to ensure University meets qualifications for student loans.

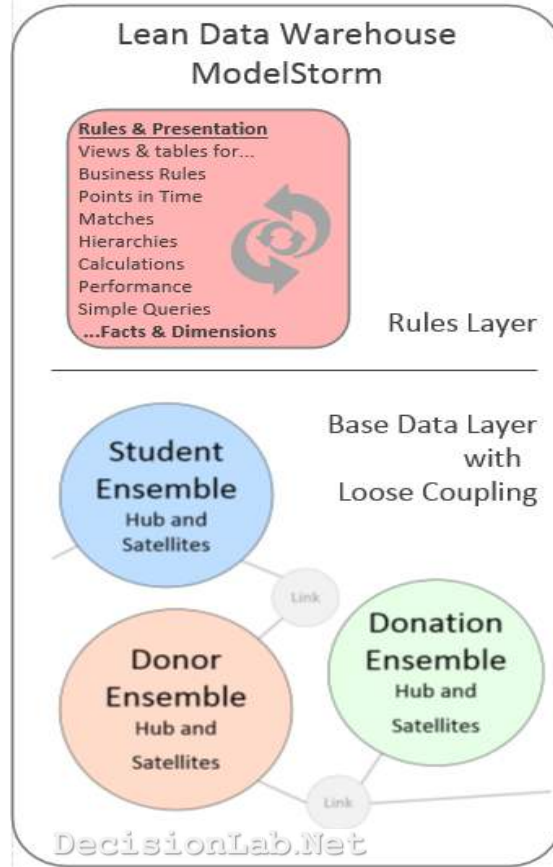

Auditors must know what family relationships exist between donors and students to monitor for conflicts of interest and uphold reputation.

Data Vault and ModelStorming

User Story:
 As a ____, I must know ____,
 so I can do ____, and we can achieve ____.

Step #1

Data Presentation Layer ModelStorm

Fact ModelStorm

Donor Donates to University ...dates

With Relationship to Donor	Makes Donation to University	(With or Without) Attending a Fundraiser	Date of Donation
Donor			

Dimension ModelStorm

Student... has a... and a... and a... and a...

Name	Counselor	Major	Status
Student...			

Facts & Dimensions Matrix

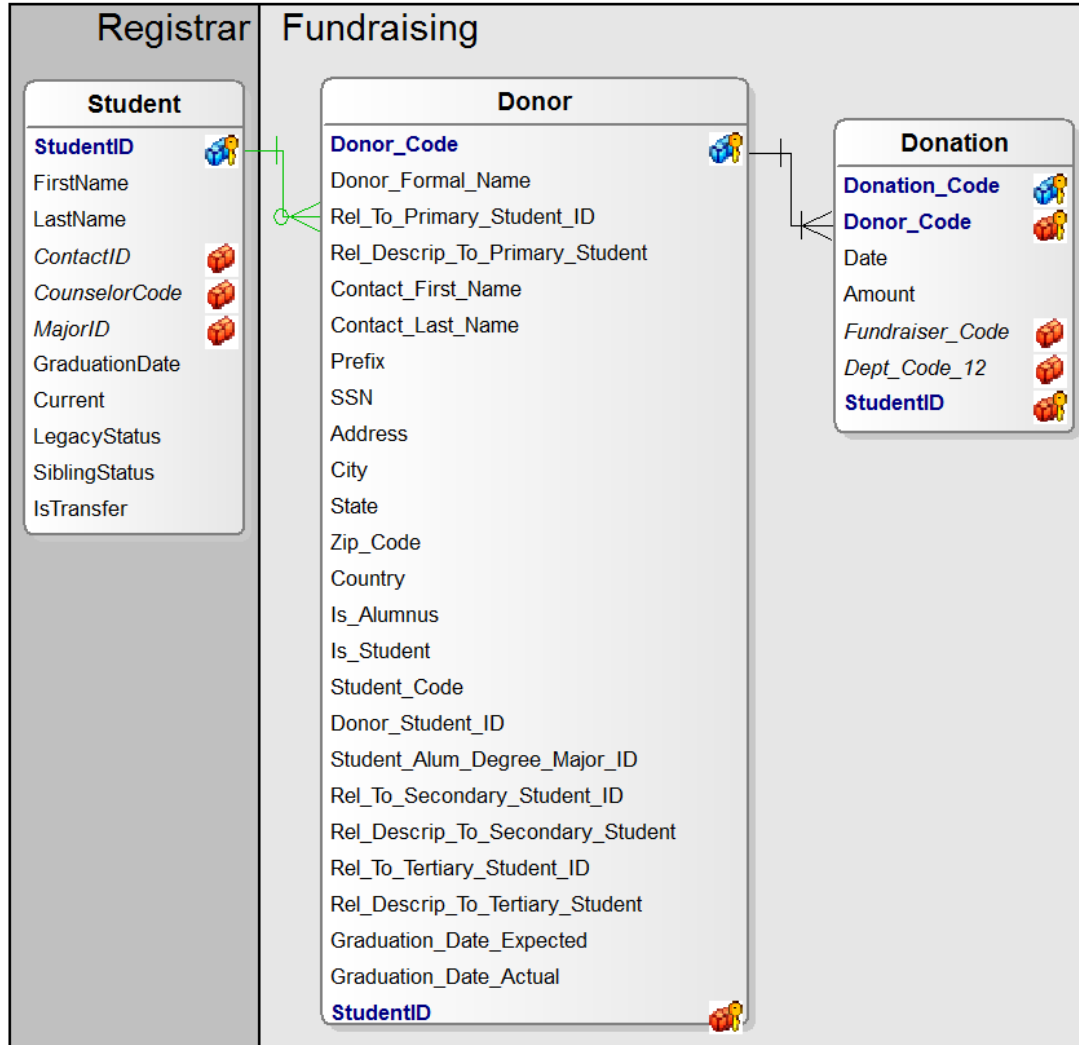

* Donations
* Student Enrollments

Facts (events of interest)	Who?	What?	How?	When? Relevant Dates
Donor Donates to University	G		X	X G
Student is Enrolled in an Academic Program (Weekly Snapshot)	G	X X X		G

Data Vault and Data ModelStorming: Fast Profile of Source Data

Data Dependencies Force Sequential Transaction Processing

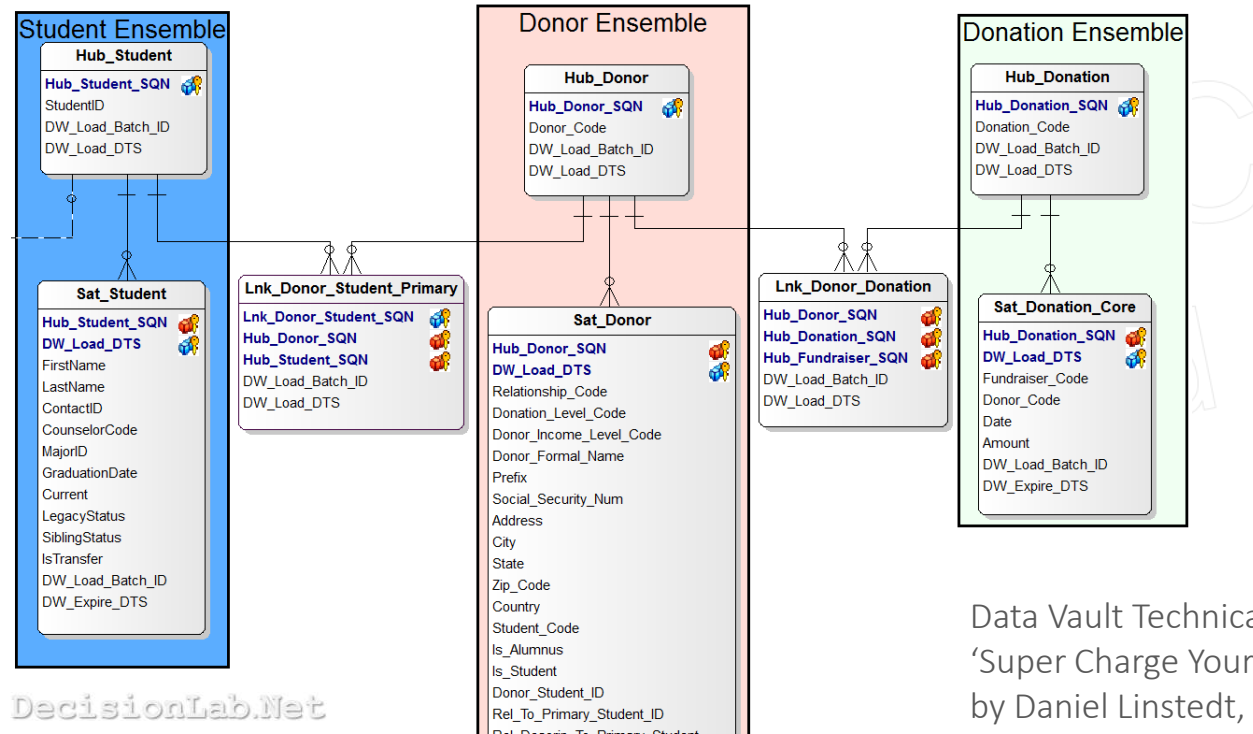

DecisionLab.Net

Data Vault Modeling, via Modelstorming, is quickly done
 High Cohesion and Loose Coupling

Delivered in **1/4** the time of old-school models.

No data dependencies between free-standing ensembles, thus
 load ensembles simultaneously, so loading time is **1/2** of old-school.

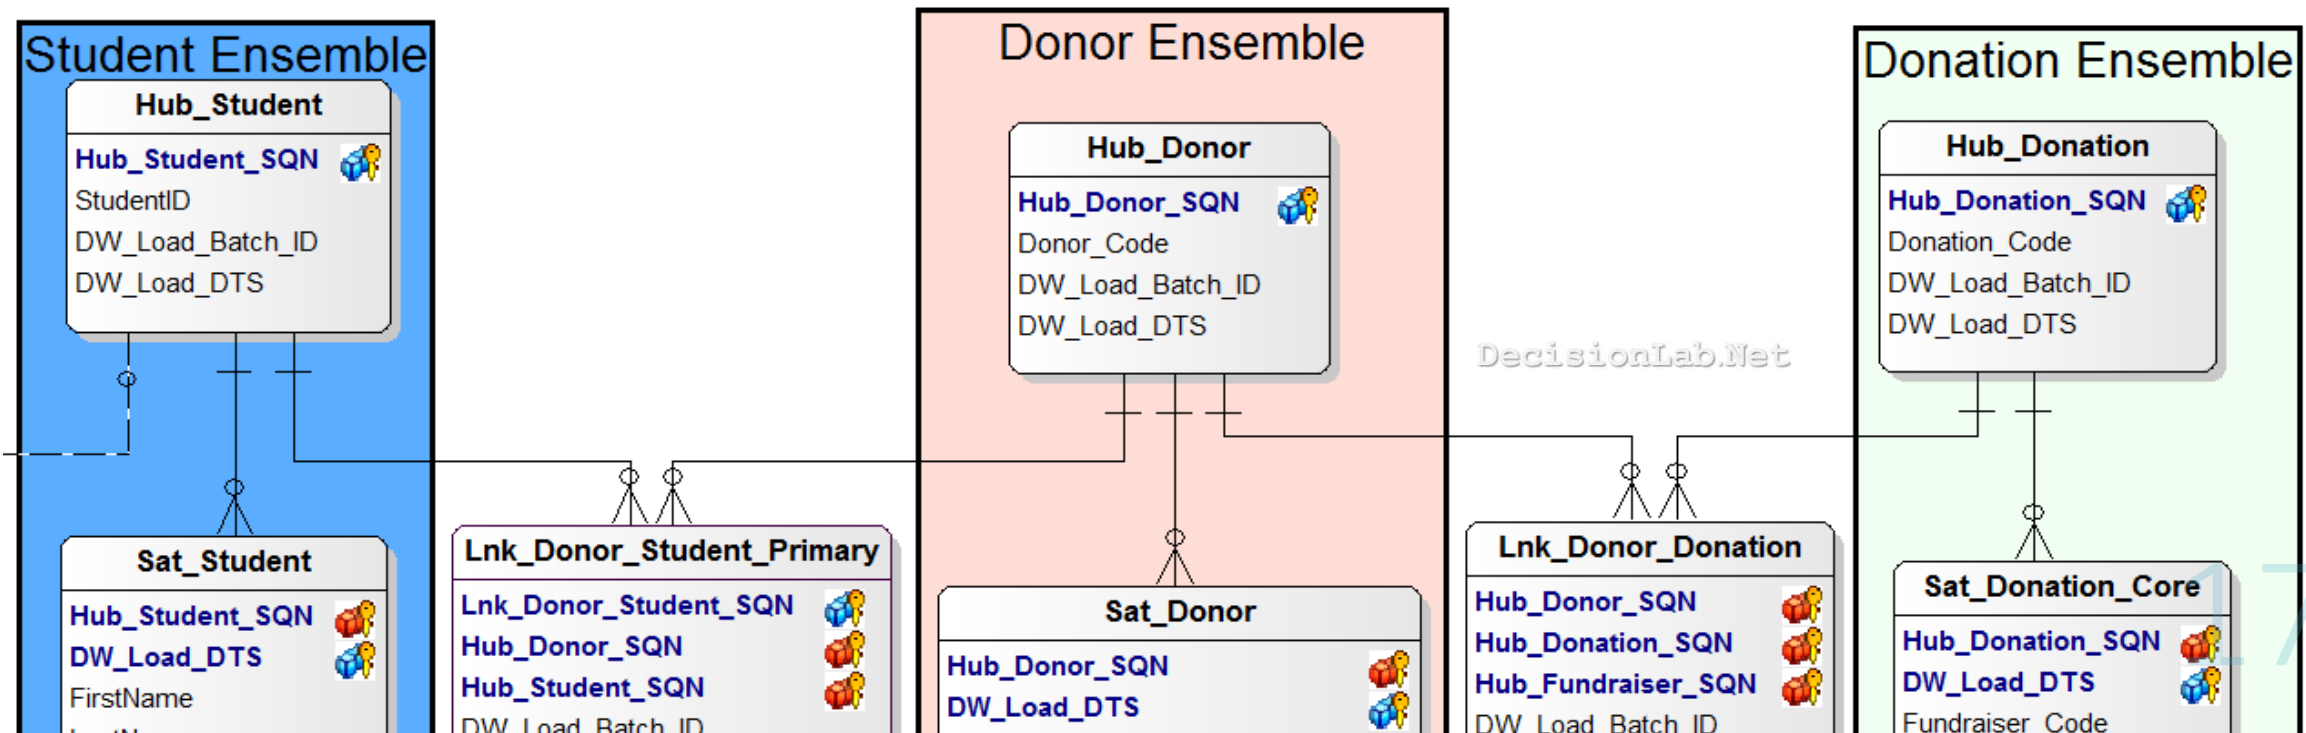

Data Vault Technical Reference:
 'Super Charge Your Data Warehouse'
 by Daniel Linstedt, LearnDataVault.com, 2008.

Summary of Data Vault Design Fundamentals

Hub: One Business Key (unique list of values); Surrogate Key as Primary Key. A Hub is free-standing, never functionally dependent on another table. Has one or more dependent Satellites.

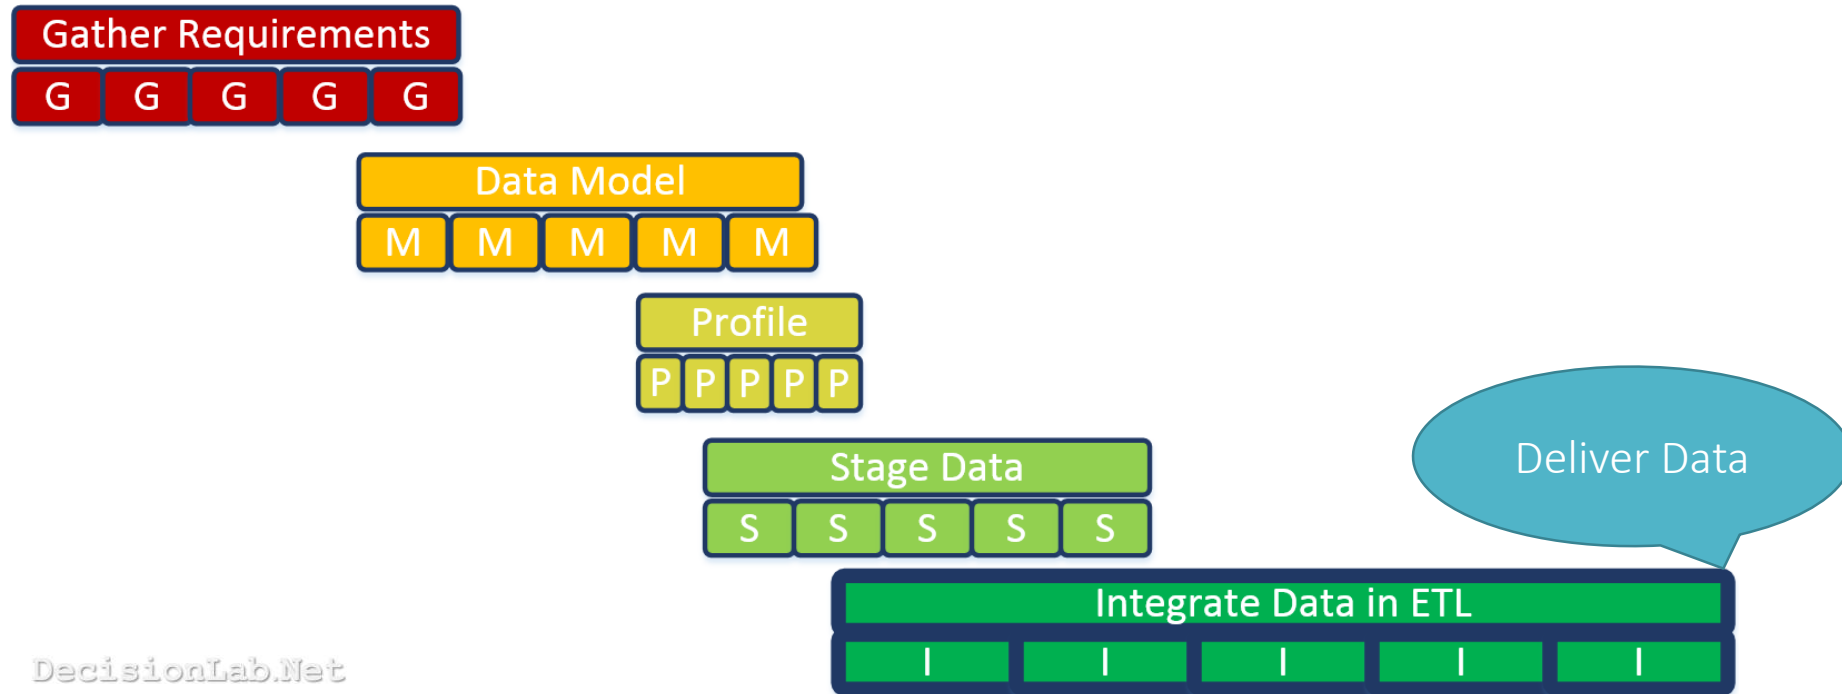

Satellite: Primary key is Hubs Surrogate Key + DateTimeStamp to capture historic versions of all fields from source table or file. Foreign key constraints are removed. Dependent on exactly one Hub.

Link: Historic relationship of records between two or more Ensembles, using new Hub Surrogate Keys. Used instead of source system's foreign keys, thus preserving correct cardinality relationships among records between tables, while removing cascading data dependencies between Ensembles, allowing faster data loads and allowing for future enhancement without re-work in existing tables.

Old School Data Warehouse vs. Data Vault:
Abbreviations denote same tasks, now broken down into smaller chunks.
Assume same resources, same skill levels, same effort.

...what is wrong here?

Modelstormed Data Vault Architectural Process reduces task dependencies to a fraction, by quickly warehousing and loosely coupling the data prior to applying business rules for analytics or reporting.

DecisionLab.Net

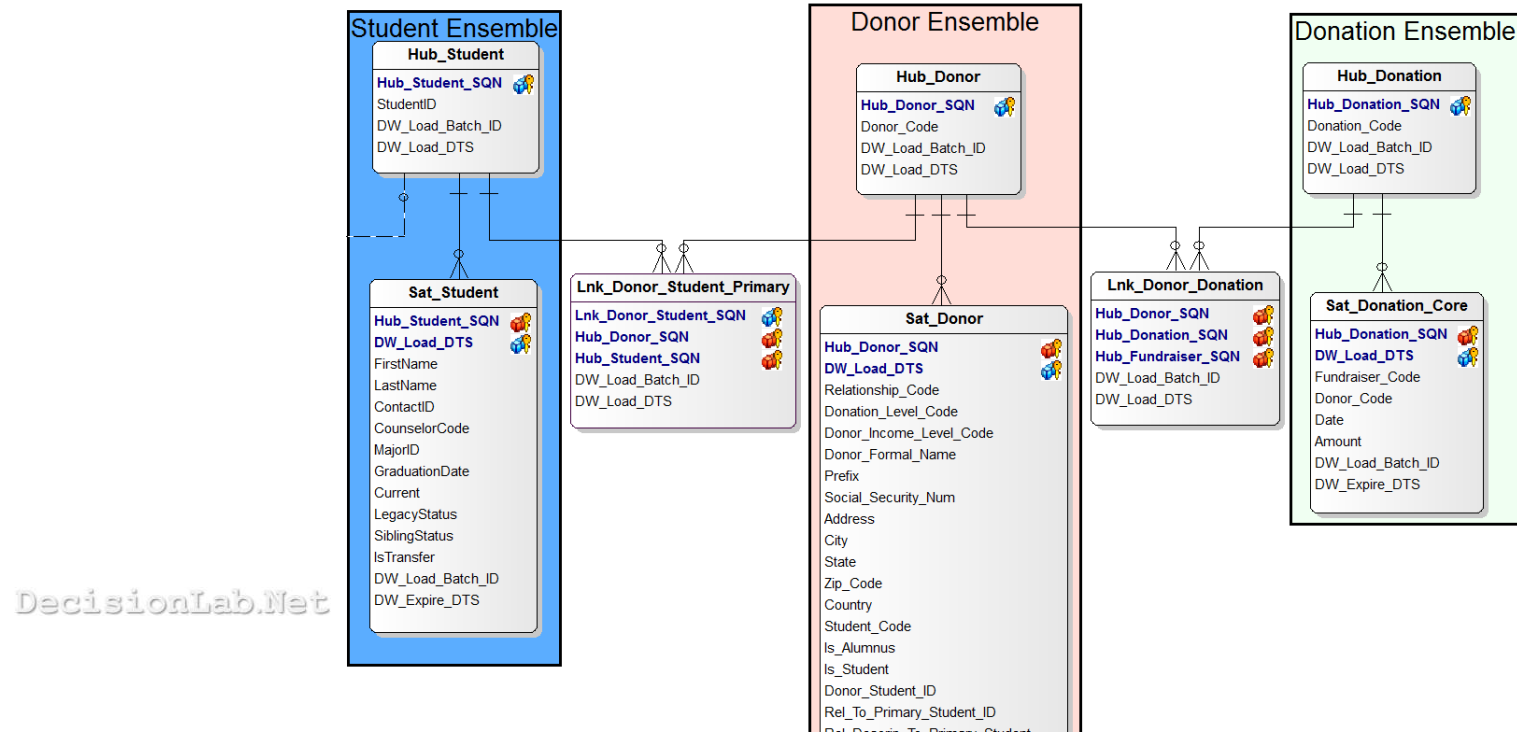

In 11th Hour, Two User Stories Change

Institutional Research must know how many students enrolled weekly, with what relationship to a Counselor, to ensure University meets qualifications for student loans.

Auditors must know what family relationships exist between donors and students and Counselors to monitor for conflicts of interest and uphold reputation.

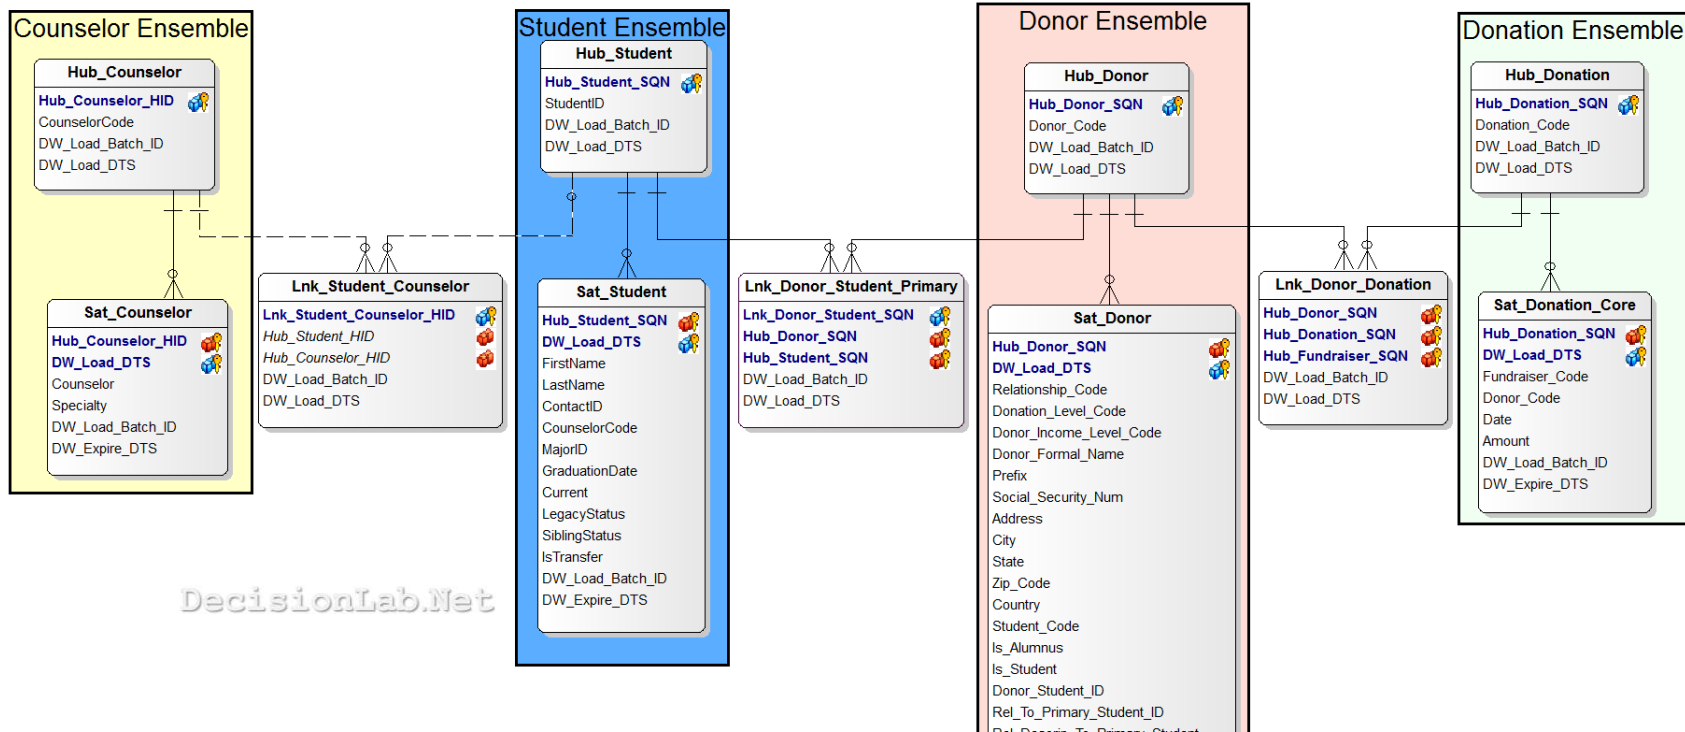

In a straight-to-star schema architecture, such requirement changes require time-consuming, costly re-engineering within the data warehouse. Here, a fact table, first built without reference to Counselor, now needs re-engineering. DecisionLab.Net

Data Vault Model: Prior to 11th Hour Change

Data Vault Model: After 11th Hour Change Lean ModelStorm Additions Complete

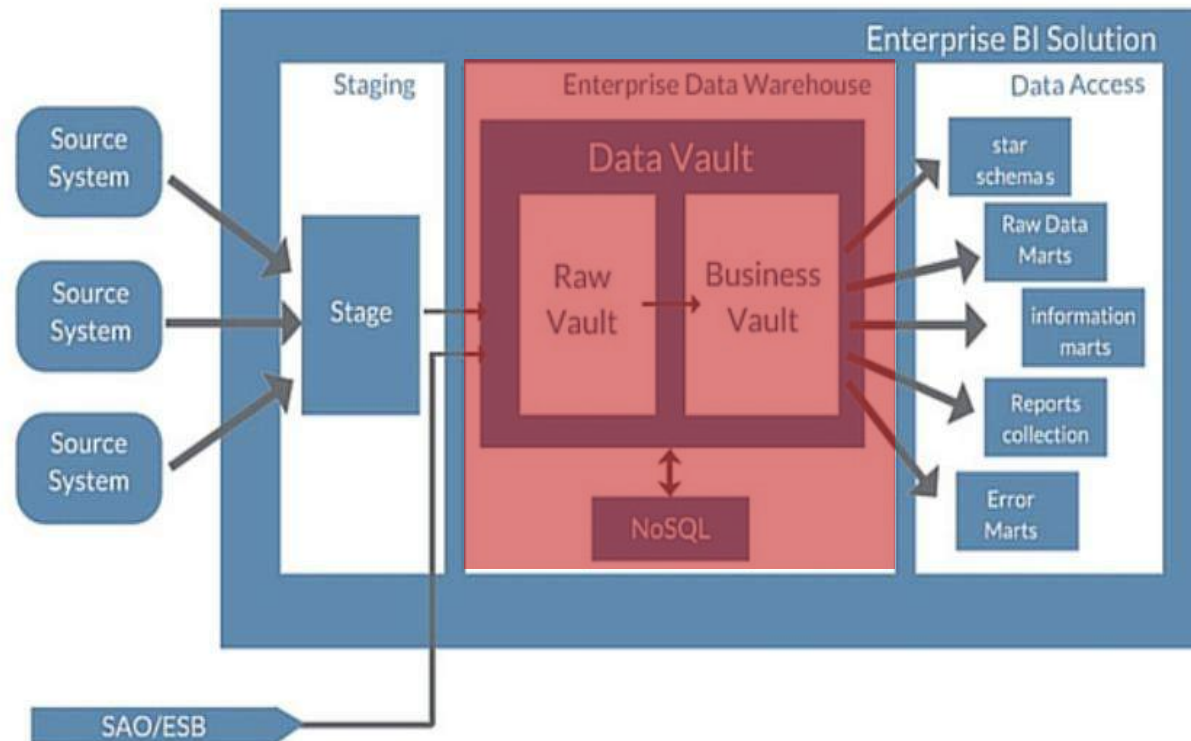

Zero changes to any existing objects, thus fast and no interference with other coding efforts. Delivered this time in $\frac{1}{4}$ the time of old-school methods.

Data Vault Architecture

Robust Integration with Big Data from Social Media, Machine Sensors, etc.

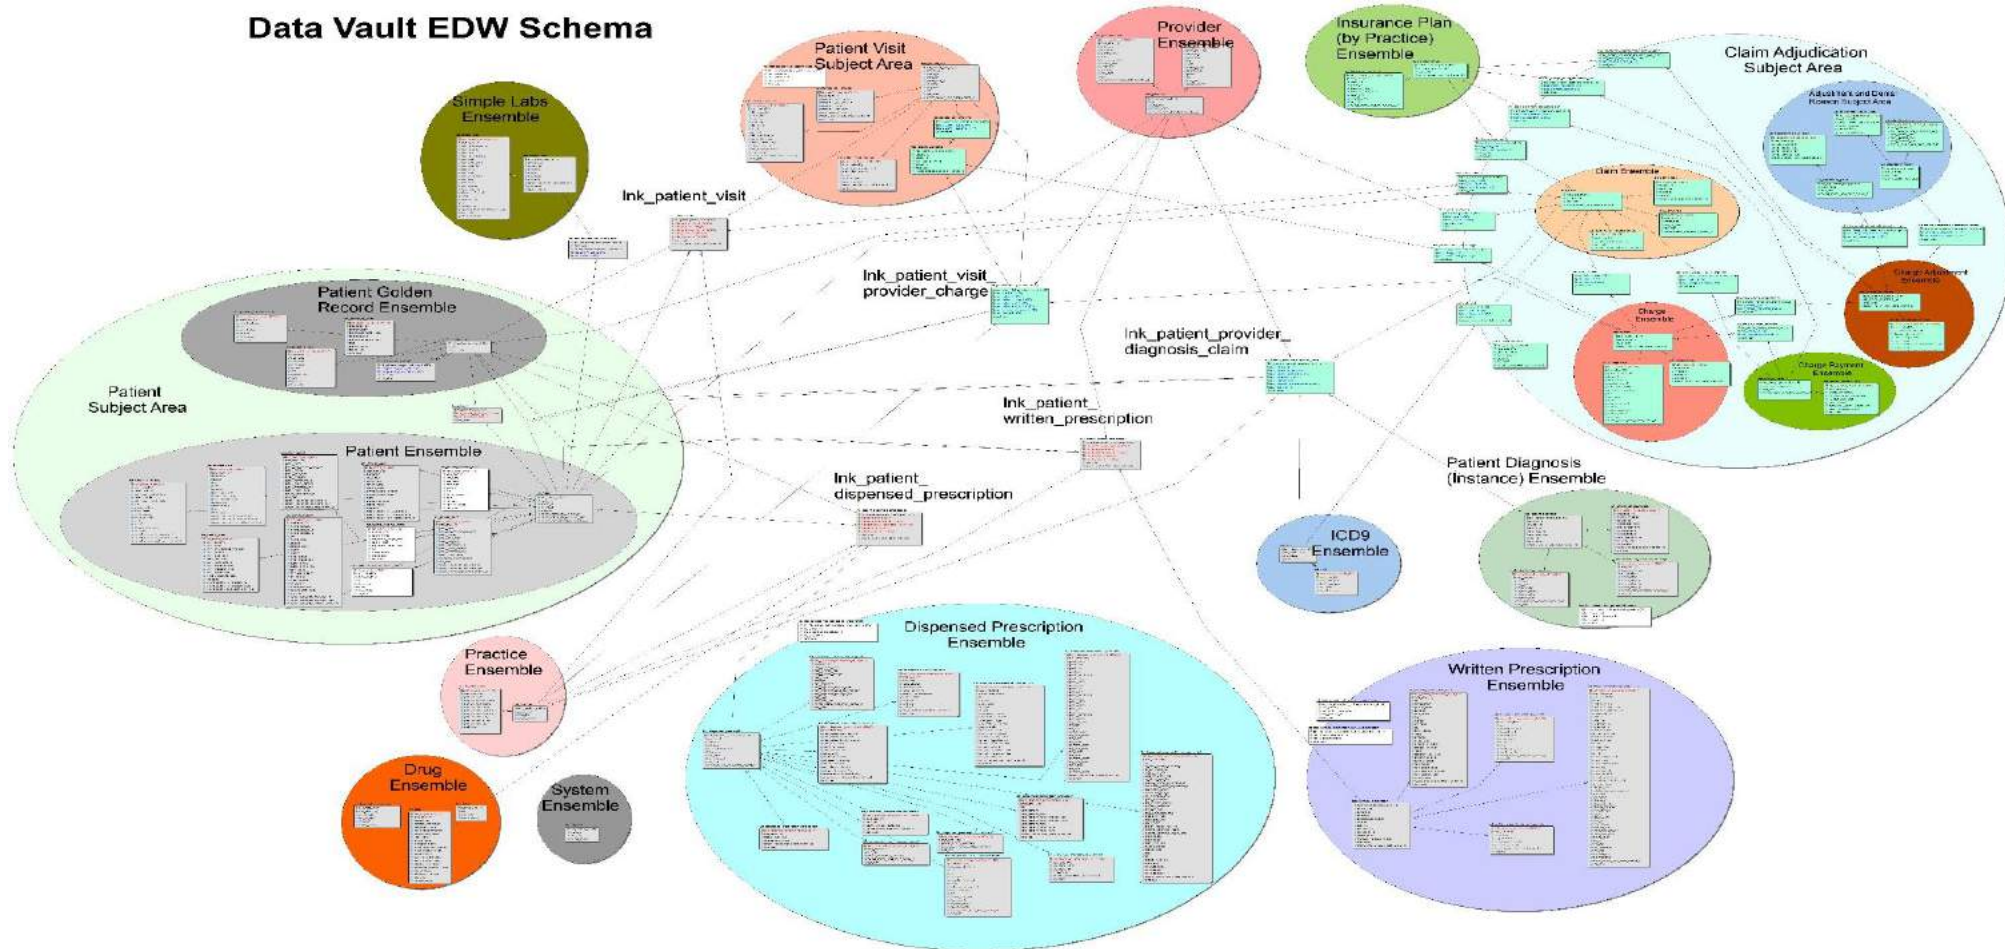

High Level Data Vault BI-Solution Architecture

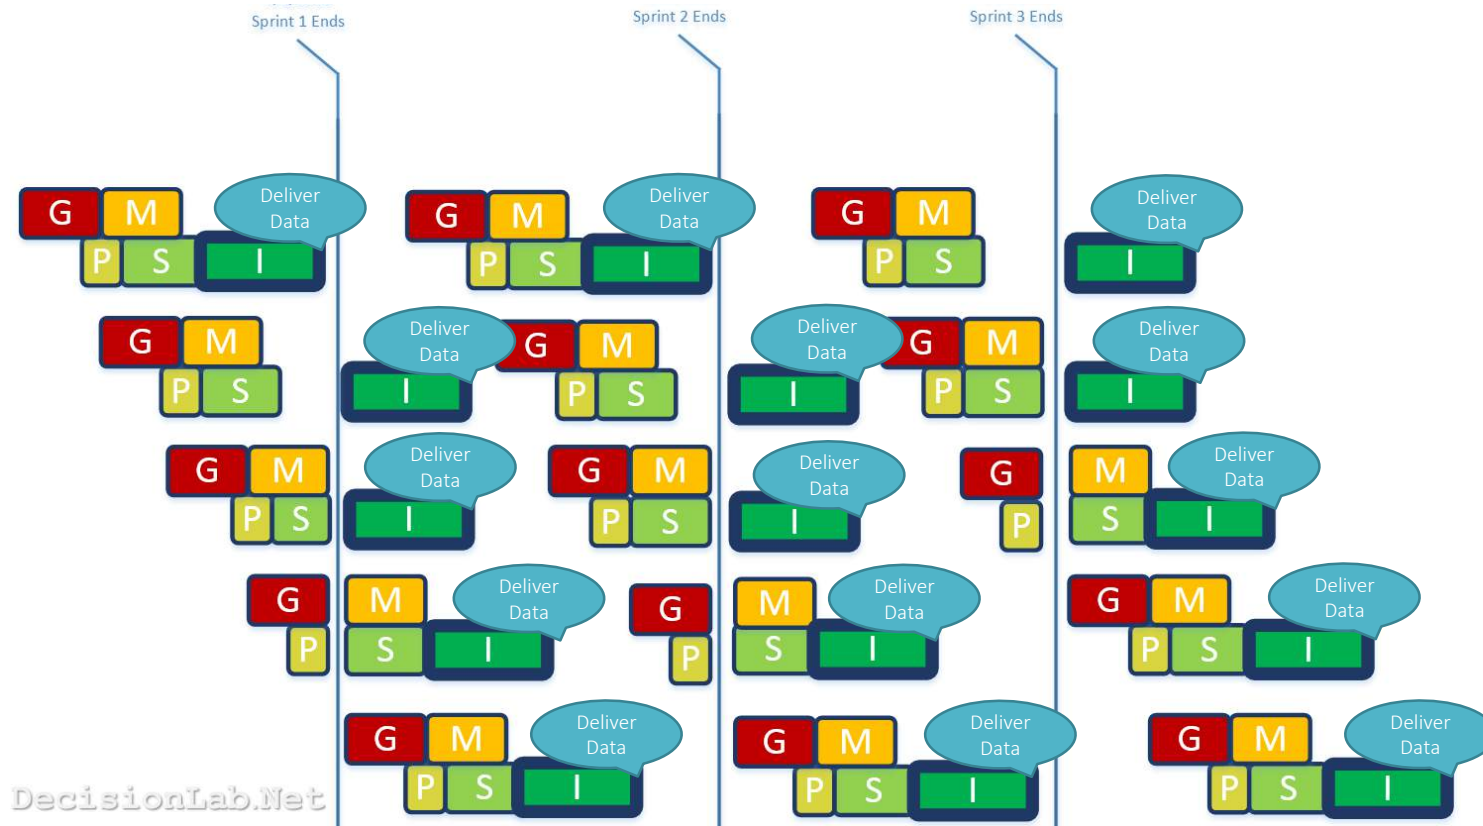

With Data Vault architecture and Modelstorming, the promise to...

“Build your integrated data warehouse now.
Easily add new operational data, new rules, and new relationships
whenever needed” ...is now a routine expectation.

Data Vault EDW Schema

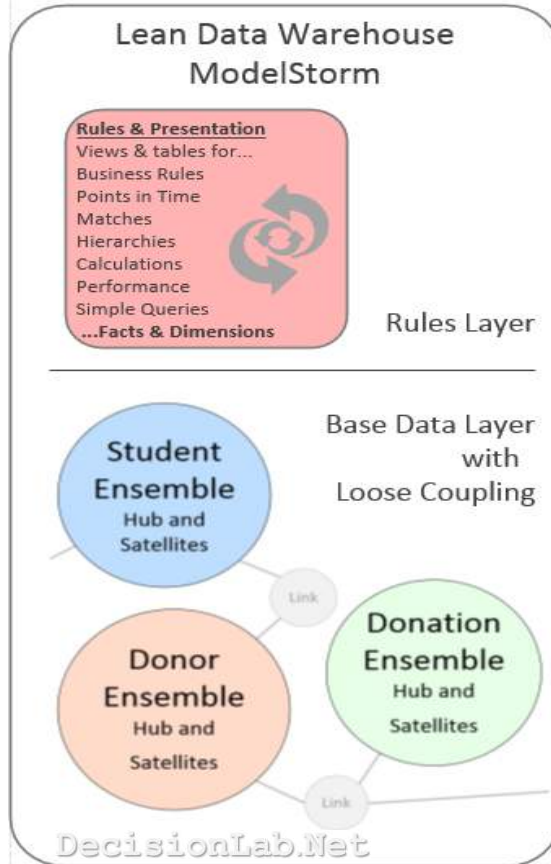

Data Vault Architecture, especially with Lean Modelstorming, reduces task dependencies to a fraction, warehousing and loosely integrating the data prior to applying your business rules for analytics or reporting.
